

Cerebro SDK Ops Briefing

Operational Playbook for November 6, 2025

Writer Security Operations

Updated November 5, 2025

Agenda

- ▶ Why the Cerebro SDK matters for Security Ops
- ▶ Where it fits in daily workflows and incident response
- ▶ Key surfaces to monitor and the guardrails in place
- ▶ Rollout plan, support channels, and next actions

What the SDK Delivers

- ▶ A unified way to interact with Cerebro agents, findings, tickets, and analytics.
- ▶ Consistent models eliminate ad-hoc API calls and one-off scripts.
- ▶ Enables faster playbook automation while keeping controls centralized.

Why Ops Should Care

- ▶ Shorter triage cycles: surface review queue status and SLA risk in one call.
- ▶ Better handoffs: align tickets, notifications, and task tracking from a single toolkit.
- ▶ Stronger audit posture: SDK enforces structured logging and error handling.

Ops Wins

- ▶ Reliable runbook automation
- ▶ Standardized reporting
- ▶ Confidence in guardrails

Daily Operations

- ▶ Review queue overview: pull priorities, assignees, and overdue tasks each morning.
- ▶ Integration coverage: spot connectors trending toward unhealthy before alerts fire.
- ▶ Health snapshots: fetch runtime analytics to confirm agent services remain steady.

Incident Response Support

- ▶ Retrieve session timelines to reconstruct decision paths during retros.
- ▶ Export review history for responders without granting database access.
- ▶ Trigger targeted notifications or ticket updates straight from incident channels.

Cross-Team Collaboration

- ▶ Share consistent status with SecEng, product, and compliance using the same interfaces.
- ▶ Leverage in-memory adapters for tabletop exercises without touching production.
- ▶ Use workflow evaluations to preview automation before requesting deployment.

Access & Permissions

- ▶ SDK honors existing roles: no elevated access beyond what tokens permit.
- ▶ Encourage short-lived tokens sourced from the standard auth pipeline.
- ▶ CSRF tokens and audit stamps are surfaced for logging into our SIEM.

Change Management

- ▶ Changesets enforce review before SDK releases ship to teams.
- ▶ Versioned exports mean automation can pin to a known behavior window.
- ▶ Recommended: align SDK upgrades with weekly ops change window.

Monitoring Signals

- ▶ Runtime health metrics highlight noisy agents, error spikes, or warning trends.
- ▶ Integration coverage ratios inform partnership outreach and customer comms.
- ▶ Task status endpoints surface delayed jobs so Ops can intervene early.

Rollout Checklist

- ▶ Identify initial playbooks (review queue digest, ticket sync, incident export).
- ▶ Pair Ops analysts with SecEng buddies for the first automation build.
- ▶ Publish quick links in the Ops runbook to the SDK scripts and dashboards.
- ▶ Schedule retro one week after launch to capture feedback and close gaps.

Support Channels

- ▶ Slack: #cerebro-ops for questions, runbook reviews, and status updates.
- ▶ Office hours every Tuesday with the SDK maintainers for pairing and demos.
- ▶ PagerDuty layer remains unchanged; SDK adds data, not another on-call rotation.

Action Items

- ▶ Ops leads nominate two candidate workflows by end-of-week.
- ▶ Request access tokens through the existing secrets process if not already provisioned.
- ▶ Drop automation ideas or concerns in the shared backlog doc before Friday.
